

M.I.T. Artificial Intelligence Laboratory

Working Paper Number 72

May 24, 1974

Revision 0

XGP FONT CATALOG

Work reported herein was conducted at the Artificial Intelligence Laboratory, a Massachusetts Institute of Technology research program supported in part by the Advanced Research Projects Agency of the Department of Defense and monitored by the Office of Naval Research under Contract Number N00014-70-A-0362-0003.

Working Papers are informal papers intended for internal use.

XGP FONT CATALOG

FONT NAMES

Font names for the standard fonts consist of:

- (1) an initial number specifying the height of the font in scan lines
- (2) an F or V specifying whether the font is fixed or variable width
- (3) special font identification or G or R for Gothic (sans serif) or Roman (serif)
- (4) B for bold face
- (5) L for light face
- (6) I for italicized

Special fonts are denoted by an initial letter of S. This indicates that the characters in the font are not of the standard character set, and are not suitable for printing text without special knowledge of the font.

Many duplications of fonts have been eliminated and characters have been re-arranged to all fall in the current (new-ascii + Stanford) position. It is hoped that the confusion introduced by these changes will reduce future confusion. To this end it is my intention to not change the standard font definitions, except for fixing obvious errors and adding missing characters. I would very much like to know of any changes to the standard fonts before they are made. If you find that the standard fonts don't do your favorite thing, by all means use a different one, and store it in your directory, but please try not to make changes in the standard ones which will affect everyone!

Superscripts and Subscripts

These fonts have a size and baseline suitable for use as sub and superscripts for 25 high fonts. They are not very useful in our implementation due to a lack of font storage space.

SUB	;SUBSCRIPTS (DERIVED FROM 20VG)
SUP	;SUPERSCRIPTS (DERIVED FROM 20VG)

Character Mode for the XGP

(Starred items are not yet implemented)

The PDP-11 program for the XGP interprets character strings in files in the following format:

Byte	Usual meaning	Escape significance
0	Null - byte is ignored	Normal
1	Normal	XGP ESCAPE 1
2	Normal	XGP ESCAPE 2
3	Normal	XGP ESCAPE 3
4	Normal	XGP ESCAPE 4
5-7	Normal	Reserved
10	Backspace	Normal
11	TAB	Normal
12	LF	Normal
13	Normal	Reserved
14	FF	Normal
15	CR	Normal
16-37	Normal	Reserved
40-176	Normal	Normal
177	ESCAPE	Normal

Normal means the definition of this byte in the current font will be printed. If this byte is undefined in the current font, it will be ignored.

ESCAPE causes the next byte to have an alternate meaning selected from the column "Escape significance".

Backspace spaces to the left the width of one space in the current font, including inter-character spacing. It will lose micel on variable width fonts.

TAB produces a column select to the column which is at least the width of a blank to the right of the current column position, and some multiple of 8-blank widths to the right of the left margin. (this computation of the width includes the inter character spacing)

LF activates the current text line. The line will be queued to be printed. This line will be printed at a vertical location such that the distance between the baseline of it and the preceeding line is equal to the vertical spacing parameter, unless this would cause the subscripts of the former line to overlap vertically with the

superscripts of this line. This line will then be pushed down to avoid this overlap.

FF, like LF, activates the text. In addition, FF causes a page eject after the current text line is printed. FF also sets the default Y position to the first line below the top of page margin on the new page. An implicit form feed is generated at the end of file. If a header has been specified, it will be printed.

The program will automatically form feed when the next text line would place characters below the bottom margin. Sequential form feeds will increment the page number but will otherwise be ignored.

CR causes a column select to the current left margin to be generated. This can be used to produce overprinting.

Backspace spaces the width of the space character in the current font to the left. It will lose micel on variable width fonts!

XGP ESCAPE 1 ('177&'001) causes the next 7 bits to be read as a special operation code. The following codes are implemented:

0-3 Font select.

The code, 0 to 3 is taken as the font identification number of the font to use.

4-37 Reserved for future use.

40 XGP Column Selector

The next 14 bits are taken as the x-position to print at next. (The intention is to allow arbitrary width spaces for text justification.)

41 XGP Underscore

The next 7 bits are taken as the scan-line number on which to underscore. It is taken as a 2's complement increment to the base line. Zero is on the baseline, positive bytes are down from it. The next 14 bits are taken as the length of the underscore.

42 Line space.

This does a line feed and then takes the byte as the number of lines between this line's baseline and the baseline of the following line.

43 Base-line adjust.

The next 7 bits are taken in two's complement as the base-line adjustment to the current font. The adjustment sticks until reset by another adjust command, a font select, or the end of line. The

intention is to allow a font to be used for subscripts and superscripts. (Increment baseline for superscript, decrement for subscript).

**** 44 Print the paper page number.**

The paper page number is set to 1 by a form feed. It is incremented each time the paper is cut. The decimal value of this count is printed.

**** 45 Accept heading text.**

The next byte is a count of bytes to follow. Those bytes will be read into the heading line. When that count is exhausted, the heading line will be printed. If a line feed or line space command is given that would cause text to be printed below the current text area, a form feed is inserted by the XGP and if a heading is defined, it will be printed.

46 Start Underline.

Set the left end of an underline. See Stop Underline.

47 Stop Underline.

The next byte is the scan line on which to write the underline (same as XGP Underscore). The extent of the underscore is defined by this command and Start Underline. If this command is not preceded by a Start Underline, it will underline from the left margin. Beware of column selects. No underline will happen until this command is given.

**50 Takes the next byte as the intercharacter spacing
This is reset to zero at the end of each line.**

XGP ESCAPE 2 ('177&'002) causes the next 7 bits to be taken as the column increment. This quantity is signed: 0-77 are positive increments 100 to 177 are negative increments (100 → -100, 177 → -1).

XGP ESCAPE 3 ('177&'003) causes the next 2 bytes to be taken as the scan line number on which to start this text line. Scan line 0 is the first scan line on the page (immediately following the cut). The topmost scanline of the present text line will be placed on the scan line indicated in this command. This command cannot space upwards on a page. If something (even linefeeds!) has been printed on this page, this code must select a line after the current position. The current position will be the lowest scan line actually used in the previous row. (zero if this command happens on the first line of a page.)

**** XGP ESCAPE 4 ('177&'004).** This escape is used to specify a vector.
It is followed by 11 bytes describing the vector:

2 bytes Y0	Scan line number of first line of vector.
2 bytes X0	Column position of left edge of first line of the vector.
3 bytes DX	Delta X. 1 bit of sign; 11 bits of integer; 9 bits of fraction.
2 bytes N	The number of scan lines on which this vector is visible.
2 bytes W	The column width of each scan-line.

The XGP program must be presented with vectors sorted by ascending values of Y0. If the vectors are not sorted, the output will be wrong. It is highly recommended that all vectors on a page occur on the first line. This not only gives the program time to process them, but allows vectors to be within the top margin, which is otherwise not possible. Otherwise, vectors must appear in text which is printed above the top of the vector.

The escape significance of codes 5 through 7, 13, and 16 through 37 is not defined at the present time but reserved for future use.

Running the XGP

The XGP, like any mechanical device, is subject to many failure modes. Unless you are very mechanically inclined I recommend that you not attempt to fix problems other than those documented here.

The problems you are likely to encounter in normal use of the XGP are:

(1) Paper running out. The PDP-10 program will type something like Drum/Web/Paper Out+Listing Aborted. The light indicating the particular problem (under the upper panel on the XGP) will be off. If the Drum light is out, something is very seriously wrong. If the Paper light is out, the XGP has just run out of paper. (See below for reloading instructions.) If the Web light is out, the Drum cleaning web has just run out. (see below for reloading instructions.)

(2) XGP looks like it turned itself off. PDP-10 program types out Filament Cold+Listing Aborted. This indicates that the XGP has probably encountered a paper jam. In order to avoid making things worse, it immediately powers itself down. The jam is most likely just before the cutter blade, and can usually be fixed by opening the left hand door of the XGP, releasing the paper drive roller, rethreading the paper and retightening the drive roller. The machine will not power back up until the jam is cleared and the power switch has been turned off for about 15 seconds and then turned back on. If it immediately powers itself back off, either the jam has not been fixed, or you did not wait long enough before powering it back on.

(3) Copy too dark, too light. Everyone has a favorite setting and no one will ever be happy with the one that is in effect. The toner darkness control is in the access door at the back of the XGP. It is the lever labeled with L and D at the left hand side. The lever should always be at one of the three settings closest to the L mark. The adjustment takes about 40 pages to have any effect. Please move it only one notch and wait. The normal setting is one notch forward from the L position. If the copy is too light, place the control forward one notch. If the copy is too dark, place the control back one notch. It is recommended that you check to make sure the previous spastic did not place the control in an absurd location. Under rare circumstances the toner level might be low. If you think this is the problem you can examine the toner level by opening the toner dispenser and mixing the toner up with the dipstick. I recommend that you find someone who knows what they are doing. If you add toner, please be careful, since it is awfully messy stuff, and you will get it all over yourself as well as the XGP unless you are. Make sure that what you are adding says LDX Toner on it. Adding the wrong thing could take a long time to fix!

(4) Vertical black smudge marks on the copy. The XGP fuser oil needs replenishing. Ask someone who knows what to do. This is not a serious

problem.

(5) Hard glassy particles pressed into the paper. These are beads of LDX developer which have escaped the developer housing. This indicates that the XGP needs to be cleaned and possibly to have its developer changed. This is a painful process done only of dire necessity. When this is happening, it indicates a serious problem with the XGP. In general the XGP should be turned off and someone who knows what they are doing informed. The reason for this is that the developer beads are very hard and can easily scratch the surface of the drum in the XGP and ruin it.

(6) Spastic cutting. The usual symptom is partial cuts about 1/4 inch after the real cut. Adjusting the pot near the paper chute may cure this. It should generally be as far counter-clockwise as possible without this happening. Unless this is the symptom, please do not fiddle with this control, as it is probably not the problem.

Changing The Paper Roll

The easiest and safest way to change the paper roll is to loosen the big nut holding the old roll, feed some loose paper off the old roll, tear it off, and remove the old spool of paper. The new roll is then inserted with the paper feeding in the same direction, and the end of the old paper (still threaded into the XGP) taped to the new roll with scotch tape. The paper drive roller is then loosened and the new paper carefully pulled through, until the splice is past the paper cutter. Since it is really impossible to describe the ways one can lose doing this, it is recommended that you find someone to show you how to do this. If for some disasterous reason the paper should become broken, I recommend finding someone who knows what they are doing, since attempting to thread it could easily scratch the drum surface.

Replacing The Web

In general, find someone who knows to show you. For those of you who think you know, please remember to move the web away from the drum by turning the pentagonal nut counter-clockwise before removing the old web. The widget that acts like a flip flop holding the support arm must be flopped when you are done, or the support arm will come loose. For those of you who think you can follow directions, there are some on the blue wrapping of the new web.

Removing the Drum

Unless you have to, don't. If you do, please be very careful. Remember to move the developer housing away, move the web away, and use

the drum removing rod. Do not touch the surface of the drum, as it will suffer and you might too, since it is made of selenium, a well known good poison.
